Title:

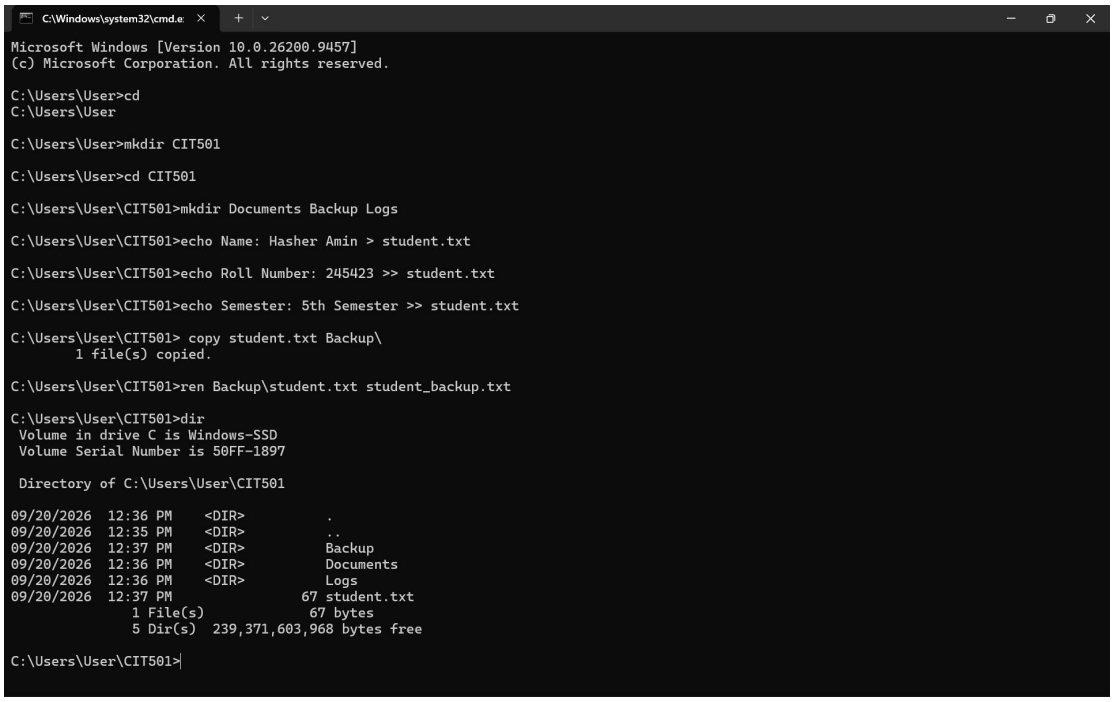

Basic Command-Line Administration in Windows

Name: Hasher Amin
Roll Number: 245423
Semester: 5th Semester
Class: BS-IT(Evening-A)

1. Directory Navigation and Folder Creation

The current directory was displayed using the **cd** command. A folder named **CIT501** was created, followed by the creation of Documents, Backup, and Logs folders. A **student.txt** file was created containing the required student information. The file was then copied to the Backup folder and renamed as **student_backup.txt**.

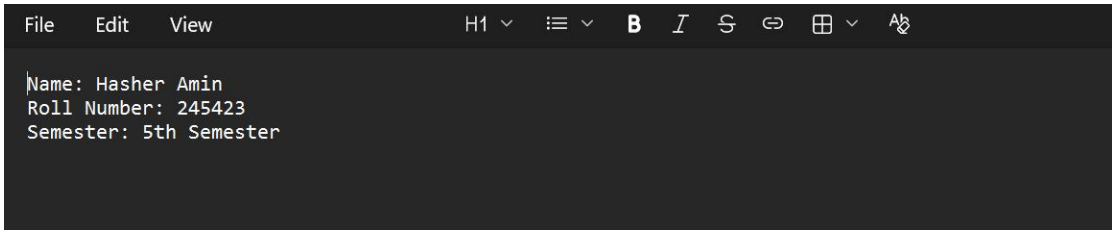

Screenshot:

2. File Creation and Backup

A text file named student.txt was created containing the student's name, roll number, and semester. The file was copied to the Backup folder and renamed to **student_backup.txt**.

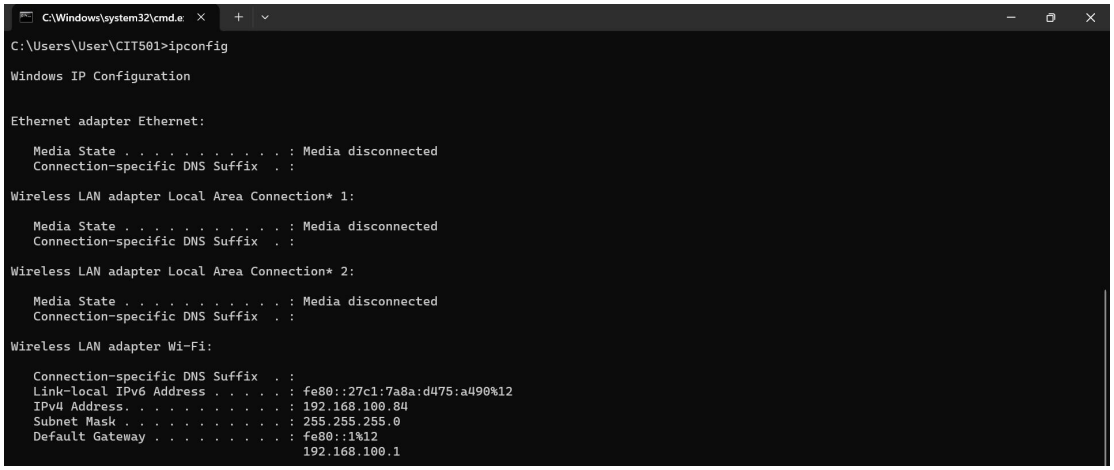

Screenshot:

3. Network Configuration:

The **ipconfig** command was used to display the computer's network configuration.

Screenshot:

4. Network Connectivity Test:

The **ping 8.8.8.8** command was used to test network connectivity. The test returned replies with 0% packet loss.

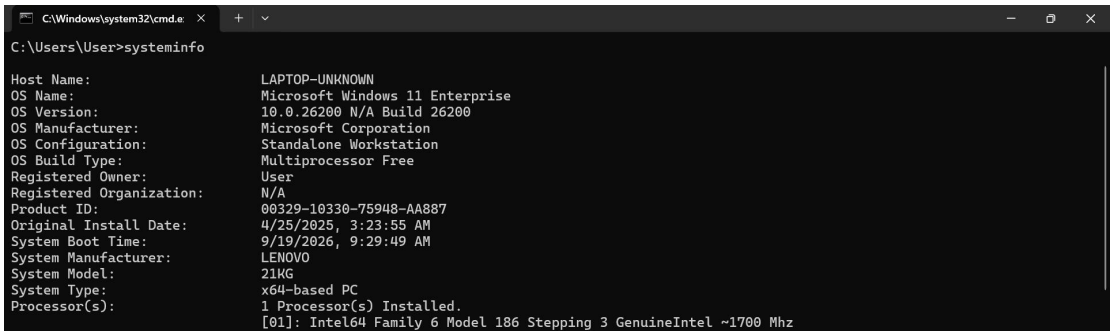

Screenshot:

5. System Information:

The **hostname** command was used to identify the computer's hostname.

Screenshot:

6. Saving Network Information:

The output of **ipconfig** was redirected to a text file named **network_info.txt**.

Conclusion:

This practical helped me understand the basic use of Windows Command Prompt. I learned how to navigate directories and create folders using CMD commands. I also learned how to create, copy, and rename files. The ipconfig and ping commands helped me understand basic network configuration and connectivity testing. I used tasklist and hostname to obtain system information. Finally, I learned how to save command output into a text file using output redirection.
